

Hi, I'm Wenqing Ji. I will complete my Master of Information Technology at the University of Auckland in March next year. I finished my bachelor's degree at Nanjing Forestry University with an academic background in Information Management.

What drew me to ICT was the ability to manage massive data, which allows me to extract the important information from abstract and massive data and then create practical tools that people can use. I really want an opportunity to apply my knowledge to build practical, intelligent systems that solve real-world problems.

Outside of study, I enjoy cycling, drawing, and gaming. These activities help me relax in my busy life.

My technical skills include programming with C#, Java, and JavaScript, HTML, CSS, and XML. I'm also confident with databases like MySQL and graph databases like Neo4j, and I've used SPARQL and Cypher for complex queries.

One of my proudest projects was building a **distributed multithreaded Chess server** from scratch in C#, using TCP sockets and HTTP1.1. I also built a matching browser-based client using JavaScript. It taught me how to handle the problem when working across both backend and frontend.

In another project, I used **SPSS** to analyze rare disease data and presented findings using professional tables. I then designed a **Mutual Aid System** combining MySQL and HTML to simulate a real-world public response platform.

These projects allowed me to apply both technical and soft skills like self-management, problem-solving, and clear communication. I'm now excited to bring these experiences into an internship or junior software role and keep growing.
